A winning combination for a Brazilian bum!

DR JOFFILY AT 64 HARLEY STREET offers the combination of two modern methods for body sculpting and shaping: VASER® Liposuction and the Brazilian butt lift, or BBL.

The VASER® liposuction procedure is a revolutionary fat removal technique that uses ultrasound to break up fat, leaving the surrounding nerves and blood vessels virtually intact. The technique uses a small probe to deliver ultrasonic vibrations to the treatment area which liquifies only the fat tissues which are then removed via a small cannula. It is a selective method that targets only the fat tissue and preserves vessels and nerves, minimising discomfort and bruising. The procedure is normally performed under general anaesthetic. Down for VASER® is short, with patients able to resume their regular activities in around five to seven days. Well suited for all body areas, the procedure is much less invasive than other methods and gives a smooth, natural-looking appearance and little downtime.

The Brazilian butt lift, also known as buttock augmentation or BBL surgery, is gaining in popularity in the UK owing to some high-profile celebrities undergoing the procedure. It enhances the bottom's volume and allows the creation of a desirable shape via liposculpture, a method where fat from other areas of the body is extracted and injected into the buttocks.

The combination of VASER® liposuction to extract the fat cells with the BBL technique

provides the safest way of getting the desirable 'Brazilian bum' and hourglass body shape.
